

# Education and professional development of mathematics teachers in Korea

**Park, Han Shick and Shin, Hyunyoung<sup>1</sup>**

Korea National University of Education, The Republic of Korea

RL

Regular Lecture

## *Abstract*

*It is undeniable that teachers play the principal role in education. This is why education and professional development of teachers are so important. Some recent works have made this fact clearer. In America, in particular, many reports and research papers have recently been published on these issues. In this paper, we first introduce briefly the current system of education, employment, and professional development of mathematics teachers in Korea. Then we mention a research project on education of mathematics teachers. The final report of the project contains some suggestions for curricula in the departments for education of mathematics teachers. We describe one example of an ended syllabus which implements those suggestions. The example is on Modern Algebra I.*

## **Education of mathematics teachers**

In Korea, there are three kinds of institutes where prospective teachers are educated. We remark that any candidate having a aching certificate needs to pass a national examination to be a classroom teacher of the national or public schools<sup>2</sup>.

### *Teacher education institutes*

These are the typical institutes for educating teachers. Every graduate is given a the teaching certificate. There are three types of university (or college) for teacher education.

- (1) *Universities for educating elementary school teachers only*  
There are 11 such universities which are national. Ewha Women's University is not only for educating teachers. It is the unique private university that is also educating elementary school teachers.
- (2) *College for educating secondary teachers only*  
Many universities (national or private) have a college for educating secondary teachers<sup>3</sup>.
- (3) Korea National University of Education  
This is the unique national university only for educating teachers for all levels of schools. This university is educating teachers for kindergarten, primary schools, and secondary schools.

---

<sup>1</sup> Department of Mathematics Education, Korea National University of Education, Darak-ri, Gangnae-myeon, Cheongwon-gun, Chungbuk 363-791, Korea. Email: shickhan@lycos.co.kr and shin@knue.ac.kr

<sup>2</sup> However, every private school has the full authority of employing teachers who have the certificate.

<sup>3</sup> In fact, there are 31 departments of mathematics education in Korea. Ewha Women's University is educating elementary teachers as well as secondary teachers.

### ***General universities***

The departments of mathematics of general universities is not for teacher preparation. Usually, however, these departments have some students who want to become teachers. A small proportion of them are selected. They take the required pedagogical courses including field experience. At graduation, they are given a teaching certificate. One weak point of this case is that the mathematics courses they take at the mathematics departments are usually separated from school mathematics.

### ***Graduate schools of education***

There are many graduate schools of education. Many of them are for professional development of in-service teachers. But some of them are educating prospective teachers. The students in these programs are graduates with a mathematics major. They take the required pedagogical courses including field experience. At graduation, they are given the teaching certificate with a Master's degree of education. The problem that the mathematical courses they took in undergraduate school were quite separated from pedagogy has to be remedied during two years of teacher preparation.

RL

Regular Lecture

### **Employment of teachers**

As mentioned before, to be a teacher of national or public schools every prospective teacher with a teaching certificate should pass a national examination, called Teachers Employment Test (TET). TET consists of two phases. The first phase is a paper examination. The questions of the test can be categorized into three areas: mathematics (50%), mathematics education (20%), and general education (30%). If an examinee is successful in the first phase, she/he can join the second phase<sup>4</sup>. The second phase is varying depending on the provincial education bureau. The performance and teaching ability as a teacher is the main concern of this phase. If you are successful in TET, you can enter the classroom as a teacher after a short period of orientation organized by each provincial education bureau. Obviously, TET has serious impacts on the curriculum of teacher educating institutes.

### **Professional development of in-service teachers<sup>5</sup>**

The official programs for professional development of teachers are offered by graduate schools of education or by the re-training center of each provincial education bureau. Unfortunately, these programs don't seem to be very effective. As a result, professional development through small study groups consisting of fellow in-service teachers is strongly recommended. Nowadays the Korean Society of Mathematical Education invites various study groups to workshops to encourage such activities and to offer opportunities of sharing ideas and experiences.

We have recently developed a questionnaire to see the level of mathematical content knowledge of in-service mathematics teachers of secondary schools (Shin 2004). It consists of 50 questions on the following algebra-related areas: Foundations of Mathematics, Linear Algebra, Number Theory, Modern Algebra, Applied Algebra, History of Mathematics, and Philosophy of Mathematics. Some examples from the questionnaire are the following:

---

<sup>4</sup> The interval between two phases is usually a couple of weeks.

<sup>5</sup> Recently Korea has developed much interest in gifted education (Shin and Han 2000). As a result many institutes for ducation of the gifted have been established. However, professional development of teachers as well as developing teaching materials for these institutes are strongly demanded.

1. Which of the following concepts or claims has the least relationship with Russell's paradox?

- (1) The Axiom of Choice.
- (2) The collection of the beautiful flowers is not a set.
- (3) The system of Zermelo-Skolem-Fraenkel.
- (4) The paradox of the barber of Seville.

2. The following is the process of obtaining the least multiple of 12, 30 and 70:

$$\begin{array}{r}
 2 \quad | \quad 12 \quad 30 \quad 70 \\
 \hline
 \quad \quad 6 \quad 15 \quad 35 \\
 \\
 \downarrow \\
 3 \quad | \quad 6 \quad 15 \quad 35 \\
 \hline
 \quad \quad 2 \quad 5 \quad 35 \\
 \\
 \downarrow \\
 5 \downarrow | \quad 2 \quad 5 \quad 35 \\
 \hline
 \quad \quad 2 \quad 1 \quad 7
 \end{array}$$

At the first step, we divide all the three numbers by 2. However, at the second and the third step we divide only two numbers by 3 and 5, respectively. When we get the least multiple of four or more numbers, we use the same algorithm. Can you explain why the algorithm works?

- (1) I know the algorithm, and can explain why it works.
- (2) I know the algorithm, and can explain, not clearly but roughly, why it works.
- (3) I know the algorithm, and don't know why it works.
- (4) I don't remember even the algorithm.

3. When we determine whether a given number is a multiple of 9, we check whether the sum of all digits is a multiple of 9. Which of the following concepts is used in the algorithm?

- (1) the least common multiple
- (2) the greatest common divisor
- (3) prime number
- (4) congruence equation

4. Usually the concept "the greatest common multiple" is not defined. Why do you think so?

- (1) If we try to define it, we come up with a contradiction.
- (2) It is not simple to define it.
- (3) It is of little mathematical significance.
- (4) It is not uniquely defined.

RL

Regular Lecture

5. Which of the following explanations about the claim ' $2^0 = 1$ ' is the most reasonable?

- (1) It is just an axiom.
- (2) We can prove it.
- (3) It is sometimes claimed that ' $2^0 = 0$ '
- (4) The claim ' $2^0 = 0$ ' can be also proved.

6. What is the fundamental concept that can be used to refute the following wrong argument:

To get the value of the infinite series

$1 + (-1) + 1 + (-1) + 1 + (-1) + 1 + (-1) + \dots$ , we note that

$1 + (-1) + 1 + (-1) + 1 + (-1) + 1 + (-1) + \dots$

$$= 1 - \{1 + (-1) + 1 + (-1) + 1 + (-1) + 1 + (-1) + \dots\}.$$

Now we let

$$1 + (-1) + 1 + (-1) + 1 + (-1) + 1 + (-1) + \dots = S, \text{ then } S = 1 - S.$$

Therefore,  $S = \frac{1}{2}$ .

- (1) density
- (2) continuity
- (3) fieldconvergence

7. We are given the general linear equation:  $ax = b$ . If  $a = 0$  and  $b = 0$  then it has infinitely many solutions. If  $a = 0$  and  $b \neq 0$  then it doesn't have any solution. Now, if  $a \neq 0$  the it has the unique solution

$$a^{-1}b = \frac{b}{a}.$$

From the above argument we can see that the number of solutions to the equation depends on the value of a. Now we consider a system of two linear equations with two variables. The system can be expressed as  $AX = B$ . Here  $A$  is a  $2 \times 2$  matrix and  $X$  and  $B$  are  $2 \times 1$  matrices. Now what feature of  $A$  determines the number of solutions of the given system

- (1) determinant
- (2) trace
- (3) eigen-values
- (4) eigen-vectors.

8. When we solve the linear equation  $x + 3 + x = 2 + 3$ , which of the following concepts or properties is not used?

- (1) identity
- (2) inverse element

- (3) commutativity
- (4) calar multiple

We did a pilot test using the questionnaire and found out that the university mathematics courses are quite separated from school mathematics. We are scheduled to collect data from more than 100 mathematics teachers. The data is expected to enable us to develop better curricula and courses for teacher re-training institutes.

### **A research project on education of mathematics teachers**

Recently the Korean Research Foundation has launched a project for developing the curriculum and teaching/learning materials for the departments of mathematics education at the various teacher-educating universities. The products are following:

- (1) Extensive survey on related literature
- (2) Suggestions for, and developing a curriculum of, mathematics department of teacher educating universities
- (3) Extended syllabuses of 26 key courses of the mathematics departments of teacher educating universities. Each syllabus consists of about a 100 page of description.
- (4) A list of about 300 non-professional books which are recommended for prospective or in-service teachers of mathematics.
- (5) A list of about 200 web-sites which are recommended for prospective or in-service teachers of mathematics.

The syllabuses have been developed in accordance with the following suggestions which are proposed in the final report of the project:

- (1) To help the students to understand the foundations of mathematics.
- (2) To help the students to enjoy mathematics.
- (3) To help the students to get to know and utilize the effectiveness and usefulness of mathematics.
- (4) To help the students to do mathematics in real life.
- (5) To help the students to connect each mathematics course with school mathematics.
- (6) To help the students to integrate all branches of mathematics.
- (7) To stimulate the intellectual interest of students to induce self investigation.
- (8) To incorporate technology in some courses.
- (9) To show a good teaching model.

The following is the proposed course schedule for a department educating elementary school teachers. The numbers in the parentheses is the number of credits [Table, p. 6].

### An example

We describe the example of the syllabus on Modern Algebra I<sup>6</sup>. This course takes 45 class hours. Each class hour is 50 minutes.

1. The main ideas of this course are following:

- (1) The course is focused on 3 algebraic structures: group, ring, vector space. The basic examples are  $\mathbf{Z}$ ,  $\mathbf{Q}$ ,  $\mathbf{R}^2$ ,  $\mathbf{R}^3$ ,  $\text{Mat}_2(\mathbf{R})$ ,  $\mathbf{Q}[x]$ ,  $\mathbf{R}[x]$ . The definitions, examples, and basic properties of these algebraic structures are introduced in parallel. Various contents of school mathematics are mentioned. Some examples of them will be given later. This course is neither about group theory nor about ring theory. Understanding important algebraic structures through basic examples and school mathematics is the main purpose.
- (2) Substructures (subgroup, subring, and subspace), quotient structures (with normal subgroups and ideals), and direct sums are introduced in parallel. Some concepts (subset, partition by an equivalence relation, Cartesian product,  $n\mathbf{Z}$ ,  $\mathbf{Z}_n$ , and matrix and determinant, for examples) in set theory, number theory, and linear algebra are naturally mentioned.
- (3) Homomorphism and the linear mapping are introduced in parallel. Various functions (functions in set theory and continuous functions in calculus, for examples) are mentioned.
- (4) Lagrange's Theorem is proved. It would be helpful for the students to compare the theorem with the following facts;
  - (i) In set theory:  $|X \cup Y| = |X| + |Y| - |X \cap Y|$
  - (ii) In linear algebra:  $\dim(X+Y) = \dim X + \dim Y - \dim(X \cap Y)$
  - (iii) In ring (field) theory:  $[L:F] = [L:K][K:L]$  for  $F \subseteq K \subseteq L$ . This fact will be proved later in this course.
- (5) The basic properties of maximal ideals are proved and some finite fields (of order 4, 8, 9) are constructed. The prime fields  $\mathbf{Z}_p$ ,  $p$ : prime, are mentioned.
- (6) A topic which needs number theory, group theory, and ring theory. The following is such an example: For a ring  $R$  we define  $R^*$  to be the set of all units. Note that  $R^*$  forms a multiplicative group, called the group of units. Now discuss the group  $\mathbf{Z}_n^*$  with respect to following concepts:
  - (i) The Euler function
  - (ii) Finite abelian group
  - (iii) Cyclic group
  - (iv) The existence of primitive elements
  - (v) Isomorphism between  $\mathbf{Z}_8^*$  and  $\mathbf{Z}_{12}^*$ .
- (7) Field extension and constructible numbers are studied briefly. The interplay of algebra and geometry is explained. Some examples will be given later.
- (8) Some students will take the advanced course (Modern Algebra 2 for Teachers). This course mainly deals with Galois theory. To be ready for the course the students will be given some homework for the vacation.

2. It is worth pointing out that the commutativity, associativity, and distributive properties are deeply connected with finiteness and convergence. The following examples would be helpful:

---

<sup>6</sup> Even though we don't introduce them here, Linear Algebra and Its Applications is deeply interwoven with algebraic coding theory, and Number Theory and Its Applications with cryptography.

- (1) Discuss the following solution:

$$\begin{aligned} & \frac{1}{1 \cdot 2} + \frac{1}{2 \cdot 3} + \cdots + \frac{1}{n \cdot (n+1)} + \cdots \\ &= \left(1 - \frac{1}{2}\right) + \left(\frac{1}{2} - \frac{1}{3}\right) + \cdots + \left(\frac{1}{n-1} - \frac{1}{n}\right) + \left(\frac{1}{n} - \frac{1}{n+1}\right) + \cdots \\ &= 1 - \frac{1}{2} + \frac{1}{2} - \cdots - \frac{1}{n} + \frac{1}{n} + \cdots \\ &= 1. \end{aligned}$$

- (2) Check the associativity and commutativity in the series:

$$1 - 1 + 1 - 1 + \cdots + 1 - 1 + \cdots.$$

- (3) Discuss the following solution:

$$\begin{aligned} & \lim_{n \rightarrow \infty} \frac{1 + 2 + \cdots + n}{n^2} \\ &= \lim_{n \rightarrow \infty} \left( \frac{1}{n^2} + \frac{2}{n^2} + \cdots + \frac{n}{n^2} \right) \\ &= \lim_{n \rightarrow \infty} \frac{1}{n^2} + \lim_{n \rightarrow \infty} \frac{2}{n^2} + \cdots + \lim_{n \rightarrow \infty} \frac{n}{n^2} \\ &= 0. \end{aligned}$$

- (4) Discuss the following arguments:

(i) If we let  $x = 0.999\dots$  then  $10x = 9.999\dots$ , so  $9x = 9$ . Thus  $x = 1$

(ii) If we let  $x = 1 + \frac{1}{1 + \frac{1}{1 + \frac{1}{\dots}}}$ , then  $x = 1 + \frac{1}{x}$ .

Solving this equation, we get  $x = \frac{1 + \sqrt{5}}{2}$ .

3. It is worth noting the similarity among the solutions of linear equation, a system of linear equations, and linear congruence equations.

- (1) Discuss the solution of  $ax = b$

(i) In the case that  $a = 0$  We have two cases. If  $b = 0$  there are infinitely many solutions. But if  $b \neq 0$  there is no solution.

(ii) In the case that  $b \neq 0$  there exists unique solution  $x = \frac{b}{a} = a^{-1}b$ .

- (3) Solution of  $AX = B$  where  $A$  is a square matrix.

(i) In the case that  $A$  is singular (in other words,  $|A| = 0$ ), there exist(s)

- infinitely many or no solution(s) depending on  $B$ .
- (ii) In the case that  $A$  is non-singular (in other words  $|A| \neq 0$ ) there exists unique solution  $X = A^{-1}B$ .
- (3) Compare the above results with the case of linear congruence equation  $ax \equiv b \pmod{n}$
- (i) When does the congruence equation have solutions.
- (ii) If the equation has solutions, how many are there? And what are they?

#### 4. Algebraic structures in school mathematics

- (1)  $\mathbf{Q}(\sqrt{2}) = \{a + b\sqrt{2} \mid a, b \in \mathbf{Q}\}$  forms a field. This fact is connected with the rationalization of the denominator of

$$\frac{1}{1 + 3\sqrt{2}}$$

- (2) The set  $\mathbf{C}$  of all complex number forms a field. This fact is connected with the realization of the denominator of

$$\frac{1}{1 + 2i}$$

- (3) Discuss commutativity, associativity, identity, inverse element in the following problems.

(i) Solve  $x + 3 + x = 2 + 3$

(ii) Compute  $123 \times 345 \times 0$

(iii) Compute  $123 \times 345 \times \frac{1}{123}$ .

(iv) Compute  $123 \times 345 + (-345)$

(v) Compute  $123 \times 345 + (-123)$

- (4) Applying the properties of algebraic structures, argue for the following claim: (negative number)  $\times$  (negative number) = (positive number).

#### 5. Discuss field extension in school mathematics through following problems:

(i) Geometric construction

(ii) Algebraic construction

(iii) Paper-folding.

#### 6. Discuss the interplay between algebra and geometry through following topics:

(i) Some examples in analytic geometry.

(ii) Erlangen Program by Felix Klein in 1872.

(iii) A proper picture explaining the equality  $(a + b)^2 = a^2 + 2ab + b^2$ .

(iv) Construction of numbers.

(v) Proper pictures explaining the following equalities:

$$1 + \frac{1}{2} + \frac{1}{2^2} + \frac{1}{2^3} + \dots = 2,$$

$$1 + \frac{1}{4} + \frac{1}{4^2} + \frac{1}{4^3} + \dots = \frac{4}{3}.$$

7. All the students are required to read the following books<sup>7</sup>:

- Fermats Last Theorem (S. Singh 1997)
- The Man Who Loved Only Numbers (P. Hoffman 1998)
- My Brain Is Open (B. Schechter 1998)
- Knowing and Teaching Elementary Mathematics (L. Ma 1999).
- Mystery of Aleph (A. D. Aczel 2000)
- The Elegant Universe (B. Greene 1999)
- Beautiful Mind (S. Nasar 1998)
- In Code (S. Flannery & D. Flannery 2000)
- Flatland (E. Abbott, Annotated by I. Stewart 2002).

RL

Regular Lecture

Of course some students might read some of the above books when they took Set Theory, Linear Algebra and Its Applications, or Number Theory and Its Applications.

### Conclusions

It is said that the first word that a foreign business person in Korea learns is 'bballi, bballi' which means 'hurry up, hurry up.' The bballi-bballi tradition is sometimes good in business. The problem is that it is also quite prevalent even in education. It is clear that this situation is undesirable in mathematics education. In other words, mathematics education cannot be successful with a bballi-bballi spirit. There are also other educational problems that stem from this speed-up culture.

The fervour for children education in Korea is quite remarkable (KSICMI 2004). Although the educational fervour combined with the bballi-bballi tradition may come up with some negative results<sup>8</sup>, it will surely be a tremendous power for Korean education if this fervour were used effectively. But we need to note that it is also the teachers that should organize the fervour of parents well, so as to find solutions to the various problems in mathematics education of Korea.
